

PlaceExportToJsonVisitor
::visit

PlaceExportToXmlVisitor
::visit

Monument::isOpenToPublic

```
graph LR; A[PlaceExportToJsonVisitor::visit] --> C[Monument::isOpenToPublic]; B[PlaceExportToXmlVisitor::visit] --> C;
```

The diagram illustrates a visitor pattern where two visitor classes, `PlaceExportToJsonVisitor` and `PlaceExportToXmlVisitor`, both implement the `visit` method. These methods are shown pointing via blue arrows to a target method, `Monument::isOpenToPublic`, which is highlighted in a gray box. This indicates that both visitors interact with the `Monument` object to determine if it is open to the public.
